

Running AR Test Cases & Recording the Results

The Pass and Fail commands

The "Pass" and "Fail" commands are defined on <Lispcore>Internal>Library>RELEASETOOLS. The form of use is

Pass *AR#1 AR#2 AR#3 . . .* ;Records the fact that AR Test Cases for the ARs named were run and succeeded.

Fail *AR#4 AR#5 AR#6 . . .* ; Records the fact that AR Test Cases for the ARs named were run and failed.

These two commands record each AR in a log file, along with your user name (so we know who ran it), and the current time (so we know when). These log entries will be used to

- 1) Track the current status of the AR test cases, and
- 2) Prepare the alpha-test log for Beta-test readiness review.

Running a test

When you run an AR test case, please use the Pass or Fail command to record the fact!
